## Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

## **Listing of Claims:**

1 to 19 (canceled)

- 20. (Previously presented) The disodium salt of fosfluconazole in the form of its trihydrate, its hexahydrate, or as a mixture of tri- and hexahydrates, wherein the trihydrate has a water content of about 11% w/w and the hexahydrate has a water content of about 20% w/w.
- 21. (Currently amended) A <u>hydrate</u> mix of <u>trihydrate and hexahydrate of fosfluconazole disodium salt, wherein the water content of said mix is from about 11% w/w to about 20% w/w.</u>
- 22. (Previously presented) The hydrate mix according to claim 21, wherein the water content of said mix is from about 14% w/w to about 17% w/w.
- 23. (Previously presented) The hydrate mix according to claim 22, wherein the water content of said mix is about 15% w/w.
- 24. (New) A stable mix of trihydrate and hexahydrate of disodium salt of fosfluconazole wherein the trihydrate has a water content of about 11% w/w and the hexahydrate has a water content of about 20% w/w, made by a process comprising the following steps:
- a) providing a quantity of an aqueous mixture containing the disodium salt of fosfluconazole or a composition thereof in a suitable vessel in a freeze-drying apparatus;
- b) reducing the temperature in the apparatus to bring about freezing and eutectic solidification;
- c) reducing the pressure in the apparatus to below the saturation vapour pressure (SVP) of water over ice at the temperature of the ice:
- d) maintaining the apparatus at a pressure below the SVP and, optionally, increasing the temperature in the apparatus to facilitate sublimation, until all of the ice has been sublimed;
- e) maintaining the apparatus at the pressure and temperature conditions according to step d) until the desired water content has been obtained; and
- f) either:

increasing the pressure in the apparatus to from about 60% to about 100% of atmospheric pressure (about 60.8 kPa to about 101.3 kPa) and subsequently adjusting the temperature in the apparatus to from about 5°C to about 30°C;

or

adjusting the temperature in the apparatus to from about 5°C to about 30°C and subsequently increasing the pressure in the apparatus to from about 60% to about 100% of atmospheric pressure (about 60.8 kPa to about 101.3 kPa).
